

LITECURE LASER HONORED AS ONE OF THE BEST PRODUCTS OF 2009

Monday, December 28th, Dr. Marty Becker, resident veterinarian of Good Morning America and best selling author, proclaimed Companion Therapy Laser LiteCure to be one of the best veterinarian products of 2009.

Dr. Becker and his team spent all year selecting exciting and revolutionary new products that treat medical problems in the veterinarian field.

According to Becker, LiteCure is exciting new technology that is successful in speeding the wound healing process (and surgical healing process) and reducing pain and inflammation from common pet ailments such as otitis (ear infections), hip dysplasia, arthritis, and other joint related problems. LiteCure is designed specifically for animals but the same technology is approved by the FDA for human use. In fact LiteCure traveled to the Beijing Olympics treating athletes from basketball players to race horses!

Laser therapy uses the science of photobiostimulation to speed healing. As the laser reaches an injured area, the interaction of light and tissue encourages the production of ATP inside damaged cells. ATP production in the mitochondria of an injured cell begins the cascade of events necessary for healing such as collagen and enzyme production, cell growth, and increased blood flow. As our beloved pets age, recovery time from trauma, surgery, or simply the need of relief from every day aches and pains is needed. This technology offers drug-free, surgery-free, pain free relief. Even if drugs are still needed, the dosage can be less. Best of all there are no side-effects and it's totally non-invasive. Depending on the problem, patients can find relief after fewer than 6 treatments.

If you believe your pet could benefit from this revolutionary technology, call New River Animal Hospital, in Nimitz, the first hospital in West Virginia to have LiteCure.
